

Instructions to Delete Buying Buddy (JS Version)

You are completely **removing** an existing Buying Buddy installation from this HighLevel AI Studio (React + Vite + TypeScript) project. Work carefully and **do not change anything until I have approved your plan**.

Important — do not touch my site's styling. I am only removing Buying Buddy assets. Do **not** rename, remap, prefix, scope, or otherwise modify any of my site's CSS, design tokens, CSS variables, Tailwind config, theme, or shared UI components. The **only** style-related change you may make is removing the old Buying Buddy plugin's own theme `<script>` as part of removing the plugin block (Step 5).

Step 1 — Verify the current setup (inspect only, change nothing)

Confirm the project matches the expected pattern and report what you find:

1. **The old plugin block**, normally in `index.html` (in the `<head>`). It looks similar to this (values will differ):

HTML

```
<!-- Buying Buddy plugin v5.02 for HighLevel; Authorized Domain: example.com -->

<!-- ** DO NOT DEFER ** This must load at the top of the page, e.g. in the page
head. -->

<script src="https://www.mbb2.com/version3/css/theme/acid/XXXXXXXX"></script>

<script>

  var MBB = {seo : "false", data:{ acid : "XXXXXXXX" } };

  function mbbMapLoaded(){ MBB.googleMaps = true; };

</script>

<script
src="https://maps.googleapis.com/maps/api/js?callback=mbbMapLoaded&libraries=place
s&key=AIza..."></script>

<script
src="https://d2w6u17ngtanmy.cloudfront.net/scripts/my-buying-buddy.5.0.js.gz"></sc
ript>

<!-- End Buying Buddy Plugin. Copyright 2003-2025 -->
```

2. **The foundation pages:**

- The **Search Results** page — the route/page that contains `<bb-widget data-type="SearchResults">` or `<div id="MBBv3_ListingResults">`.
- The **Property Details** page — the route/page that contains `<bb-widget data-type="SearchDetails">` or `<div id="MBBv3_SearchDetails">`.
- For each: note the file path, the route path it is mounted at (e.g. `/listings`, `/property/:id`), and any navigation menu items that link to it.

3. **The Disclaimer widget** (`<bb-widget data-type="Disclaimer">` or `<div id="MBBv3_Disclaimer">`), typically in a shared footer component.

4. **Every other widget element** used anywhere else in the project. Two forms to look for:
 - **Standard widgets:** `<bb-widget data-type="..." ...>` — for each, note the file and the `data-type` value.
 - **Legacy widgets:** `<div id="MBBv3_...">` — for each, note the file and the `id` value. These are an older form of the same Buying Buddy widgets and **will be deleted** the same as standard ones.
5. **Possible invalid/foreign widgets:** elements like `<div className="bb-widget" data-bb-widget="idx" data-bb-id="...">` use a different attribute structure (`data-bb-id`) and are **not** valid Buying Buddy widgets. Note the file for each. These will **not** be deleted; you will list them for me to review manually.

Safety check — abort if this is a mixed install. If you find any of the following, the site has (or partially has) the **new** `@buyingbuddy/react` package and this Removal prompt is **not** the right tool. Stop, report what you found, and tell me to use a different prompt:

- `@buyingbuddy/react` in `package.json` or `package-lock.json`.
- A `BuyingBuddyProvider` wrapper anywhere in `src/main.tsx`, `src/App.tsx`, or similar app root files.
- Any `<BuyingBuddyWidget ...>` components in the project.

Step 2 — Count and categorize

Report:

- The total number of files/pages that contain widgets, and the total number of widgets overall (counting both standard `<bb-widget>` and legacy `<div id="MBBv3_...">`).
- Which pages are the **foundation pages** (Search Results, Property Details) — these will be **deleted in full** — versus **content pages** that contain one or more widgets mixed in with page content (each widget will be removed in place; surrounding content kept).
- The **footer location** of the Disclaimer widget (file/component).
- A separate list of any **invalid/foreign widgets** (`data-bb-id` style) that you will **not** touch and are flagging for manual review.

Step 3 — Summarize your plan and ask for my approval

Before changing anything, give me a clear summary of exactly what you will do:

- Remove the entire old plugin block from `index.html` (and anywhere else it appears).
- Delete the Search Results foundation page (and its route, and any navigation links to it).
- Delete the Property Details foundation page (and its route, and any navigation links to it).
- Delete the Disclaimer widget from the footer.
- Delete every other Buying Buddy widget from each content page, **leaving the surrounding page content untouched**.
- Include the counts: pages and widgets affected.

Also tell me clearly:

- **"I will not install anything new. This prompt only removes Buying Buddy."**
- **"I will not publish your site. After the removal you should preview the site yourself and publish only when you are happy."**
- **"If anything is wrong, you can revert by restoring the backup created in the next step."**

Then **stop and wait for my explicit approval** ("yes, proceed") before doing anything.

Step 4 — Create a backup

After I approve, create a backup / restore point / version snapshot of the current site so I can roll back if needed, and tell me you have done so. If you are **not able** to create a backup yourself, stop and tell me to create one manually (or publish a restore point) before you continue — and wait for me to confirm.

Step 5 — Execute the removal

Make these changes:

1. **Remove the old plugin block entirely** from `index.html` (and anywhere else it appears): all of the Buying Buddy comment markers, the `mbb2.com/.../acid/...` theme `<script>`, the `var MBB = {...}/mbbMapLoaded()` config `<script>`, and the `my-buying-buddy.5.0.js.gz` `<script>`.
 - The block also includes a **Google Maps API** `<script>` (`maps.googleapis.com/.../js?...key=...`). Remove it as part of the Buying Buddy block, **but flag this to me** — if I use that same Google Maps API key for any other map on my site, I need to know it was removed.
2. **Delete the foundation pages:**
 - Delete the Search Results page component file in full (the file containing `<bb-widget data-type="SearchResults">` or `<div id="MBBv3_ListingResults">`).
 - Delete the Property Details page component file in full (the file containing `<bb-widget data-type="SearchDetails">` or `<div id="MBBv3_SearchDetails">`).
 - Remove their **route entries** from the router configuration (e.g. the `<Route path="..." element={...}>` lines, or the equivalent in the project's routing setup), and remove the corresponding **navigation menu links** if any exist.
 - Clean up any now-unused `import` statements for the deleted page components, but do **not** touch any other imports or unrelated code in the router/nav files.
3. **Delete the Disclaimer widget** from the footer (and anywhere else it appears). Remove **only** the disclaimer element — the rest of the footer (links, copyright, layout, columns) must be left exactly as it is.
4. **Delete every other Buying Buddy widget** from each content page:
 - For each `<bb-widget ...>` element and each `<div id="MBBv3_...">` element on a content page, **delete just the element**. Leave the surrounding page content — text, headings, images, layout, columns — exactly as it was.
 - If a wrapper `<div>` was added purely to host a single widget and would now be empty, you may remove that wrapper too. Otherwise leave wrappers alone.
5. **Do NOT delete invalid/foreign widgets**. Elements like `<div className="bb-widget" data-bb-widget="idx" data-bb-id="...">` use a different attribute structure and are **not** Buying Buddy widgets. **Leave them exactly as they are**, and list the files that contain them in your final summary for my manual review.
6. **Verify the build and that you changed nothing else**. After making all changes, confirm the project still compiles/builds with no errors, and confirm you did **not** modify any global stylesheet, design tokens/CSS variables, Tailwind config, theme, or shared UI components. If your edits introduced any syntax or import errors, fix them before reporting. Do not report the removal as complete until the build succeeds and the only changes are the items listed above.

Step 6 — Report and hand back to me

Do not publish the site. When finished, give me a summary that includes:

- Confirmation that the old plugin block (and the Google Maps loader) was removed, with the Google Maps note repeated.
- Confirmation that the Search Results and Property Details foundation pages have been deleted, along with their routes and any navigation links.
- Confirmation that the Disclaimer widget has been removed from the footer.
- How many other widgets were deleted and from how many files (note how many were standard `<bb-widget>` and how many were legacy `<div id="MBBv3_...">`).
- Any files containing **invalid/foreign widgets** (`data-bb-id` style) that you left unchanged and are flagging for my manual review. If there were none, say so.
- Confirmation that the project builds with no errors.
- Confirmation that you did **not** change any of my site's styling, design tokens, Tailwind config, theme, or shared UI components.
- Clear next steps for me: **"Preview your site to confirm everything looks right. If you want to reinstall Buying Buddy with the new package, run the Install prompt from your Buying Buddy dashboard (the 'Get the AI prompt for Step-1' button on the Add Plugin tab). If anything is wrong, restore the backup from Step 4."**

Rules for the whole job

- Do **not** change any routing, navigation, styling, or other code unrelated to this removal. The **only** routing/nav changes allowed are removing the routes and links that point to the deleted foundation pages.
- Do **not** touch my site's styling or design system. Specifically: do **not** edit, rename, remap, prefix, or reorganize any CSS variables/design tokens (e.g. `--primary`, `--secondary`), `src/index.css` (or any global stylesheet), `tailwind.config.*`, theme files, or shared layout/header/button/UI components. The **only** style-related change you may make is removing the old plugin's own theme `<script>` as part of removing the old plugin block (Step 5).
- Do **not** install any new packages.
- Do **not** delete invalid/foreign (`data-bb-id`) widgets — leave them and list them for manual review.
- Do **not** publish, deploy, push live, or release the site — and do **not** trigger any "Publish", "Deploy", "Ship", or "Go Live" action your environment offers. I will preview the site myself and publish or deploy it when I am ready.
- If you are unsure about anything, stop and ask me rather than guessing.
